

I claim:

1. A packet processing element for processing a packet, the packet processing element having a plurality of schemata programmed thereon, wherein classification information for the packet is used to select at least one schema, and wherein the selected schema is used to produce application data for the packet.

2. The packet processing element according to claim 1 wherein at least one schema includes one or more key portions and one or more application data portions, and the classification information for the packet is applied to at least one key portion of a schema to produce application data for the packet from at least one application data portion of the schema.

3. The packet processing element according to claim 2 wherein the key portions include at least one data selected from group consisting of source data and destination data.

4. The packet processing element according to claim 2 wherein the application data portions include at least one data selected from group consisting of accounting data, policing data and routing data.

5. The packet processing element according to claim 2 wherein the classification information includes one or more classification data portions, and wherein the classification data portions are compared against the key portions to select at least one schema for the packet.

6. The packet processing element according to claim 1 wherein at least one schema includes one or more key portions,

one or more key control portions and one or more application data portions, wherein the classification information for the packet is applied to at least one key portion of a schema in conjunction with at least one key control portion of the schema to produce application data for the packet from at least one application data portion of the schema.

7. The packet processing element according to claim 1 wherein the plurality of schemata include a MAC bridging schema.

8. The packet processing element according to claim 1 wherein the plurality of schemata include an IP routing schema.

9. The packet processing element according to claim 1 wherein the plurality of schemata include an MPLS schema.

10. A method of producing application data for a packet using a packet processing element having a plurality of schemata programmed thereon, the method comprising the steps of:

selecting at least one schema using classification information for the packet; and

producing the application data for the packet using the selected schema.

11. The method of producing application data according to claim 10 wherein at least one schema includes one or more key portions and one or more application data portions, wherein the step of producing the application data comprises the step of applying the classification information for the packet to at least one key portion of schema to produce application data for the packet from at least one application data portion of the schema.

12. The method of producing application data according to claim 11 wherein the key portions include at least one data selected from group consisting of source data and destination  
5 data.

13. The method of producing application data according to claim 11 wherein the application data portions include at least one data selected from group consisting of accounting data,  
10 policing data and routing data.

14. The method of producing application data according to claim 11 wherein the classification information includes one or more classification data portions, and wherein the step of  
15 applying the classification information comprises the step of comparing the classification data portions against the key portions to select at least one schema for the packet.

15. The method of producing application data according to claim 10 wherein at least one schema includes one or more key  
20 portions, one or more key control portions and one or more application data portions, wherein the step of producing the application data comprises the step of applying the classification information for the packet to at least one key  
25 portion of a schema in conjunction with at least one key control portion of the schema to produce application data for the packet from at least one application data portion of the schema.

16. The method of producing application data according to claim 10 wherein the plurality of schemata include a MAC  
30 bridging schema.

17. The method of producing application data according to claim 10 wherein the plurality of schemata include an IP routing schema.

5 18. The method of producing application data according to claim 10 wherein the plurality of schemata include an MPLS schema.

10 19. A packet switching controller comprising a processing engine, the processing engine comprising:

an element for building a key using classification information for a packet; and

a lookup table containing one or more schemata;

15 wherein the key is used to select one of the schemata for the packet, and the selected schema provides application data for the packet.

20 20. The packet switching controller of claim 19 wherein at least one schema includes a key portion and an application data portion, and the key is compared against the key portion to lookup the application data portion.

25 21. The packet switching controller of claim 19 wherein the key portion includes at least one data selected from group consisting of source data and destination data, and the application data portion includes at least one data selected from group consisting of accounting data, policing data and routing data.

30 22. The packet switching controller of claim 20 wherein at least one schema includes a key control portion, and the key

control portion is used in conjunction with the key to lookup the application data portion.

23. The packet switching controller of claim 19 wherein  
5 the schemata include at least one schema selected from group consisting of a macro access control (MAC) bridging schema, an Internet Protocol (IP) routing schema and a multi-protocol label switching (MPLS) schema.

10 24. A method of producing application data for a packet, the method comprising the steps of:  
building a key using classification information for the packet;  
selecting a schema for the packet from a lookup table  
15 containing one or more schemata; and  
reading the application data from the selected schema.

25. The method of producing application data of claim 24 wherein at least one schema includes a key portion and an  
20 application data portion, and the key is compared against the key portion to lookup the application data portion.

26. The method of producing application data of claim 25 wherein the key portion includes at least one data selected from  
25 group consisting of source data and destination data, and the application data portion includes at least one data selected from group consisting of accounting data, policing data and routing data.

30 27. The method of producing application data of claim 25 wherein at least one schema includes a key control portion, and

the key control portion is used in conjunction with the key to lookup the application data portion.

28. The method of producing application data of claim 24  
5 wherein the schemata include at least one schema selected from group consisting of a macro access control (MAC) bridging schema, an Internet Protocol (IP) routing schema and a multi-protocol label switching (MPLS) schema.

10 29. A data communication switch having a backplane and a plurality of packet switching controllers interconnected over the backplane, at least one packet switching controller comprising:

an application engine having a plurality of schemata  
15 programmed thereon, wherein classification information for the packet is used to select at least one schema, and wherein the selected schema is used to produce application data for the packet.

20 30. The data communication switch of claim 29 wherein at least one schema includes one or more key portions and one or more application data portions, and the classification information for the packet is applied to at least one key portion of a schema to produce application data for the packet  
25 from at least one application data portion of the schema.
